The Power of Flexibility - B&P Pusher Centrifuges

Unmatched Separation of Coarse Solids from Free Draining Crystalline Slurries
The Power of Flexibility - B&P Pusher Centrifuges

Slower speed means better economics. In centrifuge operations, slower rotating speeds can significantly increase the operational life of expensive components (Figure A) and reduce the risk of machine failure. Lower speeds can also mean reduced energy requirements (Figure B).

Thicker cake means purer cake. Cake thickness increases in proportion to increased basket length (see Figure C). Thicker cake is purer than thinner cake because impurities typically tend to collect near the screen surface. This less pure layer will invariably get mixed in with the rest of the batch, lowering average purity. Clearly, this will have less effect on average purity in a thicker cake than in a thinner one.

Single-step systems yield purer cake than two-step systems. Two-step systems tumble cake from one stage to the next, mixing the less pure material into the purer cake (see Figure D). Tumbling further degrades particles and causes additional loss of fines to the centrate. With B&P’s single step system the impure layer does not get mixed into the rest of the cake. This means less particle breakdown and fewer lost crystals.

B&P Pusher Centrifuges offer relentless productivity and separation of coarse solids from free-draining crystalline slurries. For gentle single-stage handling. B&P’s Pushers have been used in a myriad of applications from soda ash processing to paraxylene production all over the world. B&P pusher centrifuges remain the standard.

We started making Baker Perkins pusher centrifuges in the 1930s and customers have seen our design and performance parameters change dramatically in the 60 years since. For relentlessly productive separation of coarse solids from free-draining crystalline slurries and gentle single-stage handling, B&P pusher centrifuges remain the standard.

B&P pushers are used in a myriad of applications all over the globe. From traditional separation processes to specialized operations. Salt from dilute caustic in chloralkali plants. Military-grade nitrocellulose separation. Dilute acid cottonseed delinting. Soda ash processing. Heavy metals recovery. Paraxylene processing. And on. And on.

**Briefly, here’s how a B&P pusher operates:**

1. The feed slurry is deposited on a wedge slot filtration screen.

2. Solids collect on the screen and feed liquors drain through.

3. The pusher plate rotates with the basket and reciprocates.

4. On the forward stroke, the plate pushes solids along the screen, consolidating into a uniform cake. On the reverse stroke, fresh screen is exposed where more slurry separates.

5. Cake dries as it moves along the length of the screen and a wash liquor may be sprayed to remove impurities.

6. The cake is pushed off the discharge end of the screen and directed to the collection chute for additional processing.
Don’t Stop When You’re on a Roll
These rugged and dependable centrifuges are operated continuously - 24 hours a day for extended periods maintaining production levels unmatched by other technologies. Depending on process variables, B&P pushers regularly produce thousands of pounds of cake per horsepower hour.

The Fastest Way to Centrifuge Efficiency is Slow Motion
B&P can show you how to get more out of your centrifuge operations by slowing things down. Greater production. Longer uptime. Increased machine life. Lower operating costs. And a higher-quality product. Even with lower RPM’s, production stays high. Lower rotation speeds lengthen component life and reduce machine failure, reduce downtime, repair costs and machine replacement expense.
B&P pusher centrifuges have amassed an impressive track record for reliability under all kinds of service conditions. This dependability is founded in our sound design concepts, precise engineering and top-grade materials. Here’s an inside look at some of the B&P pusher centrifuge’s notable design features:

1. A single-piece wedge-slot screen captures solids.

2. The screen is supported by a centrifugally cast, milled-slot cage basket.

3. The cake is pushed by the reciprocating action of the pusher plate to which the feed funnel is attached.

4. The basket and pusher assemblies are attached to their respective shafts with precision tapers to assure concentricity and balance of the rotating members.

5. The main hollow shaft, which drives the basket, is carried by widely spaced, heavy-duty bearings.

6. The hydraulic pump is belt-driven by the main drive motor.

7. The pusher shaft is driven forward and backward by the internal, self-contained hydraulic piston. This assembly requires no external controls.
8. The rugged base of the pusher houses the hydraulic reservoir and provides a rigid support for the entire rotating assembly.

9. Cooling coils maintain hydraulic system temperature at optimum levels.

Obviously any machine with moving parts is subject to wear, but intelligent design can limit the effects of wear. For instance, product abrasion will cause screen wear at the pusher end of the screen. So we designed the screen so it can be pulled, turned end-to-end and re-installed to double its service life. In other cases, we have designed these machines so wear is concentrated largely on relatively inexpensive replaceable parts.

Other examples:

- The wedge-slot screen design and construction enhances the operational life of the entire machine. This screen is built of T-shaped bars that run the full length of the basket. These bars are precisely spaced and rigidly anchored by circumferential rings. This design presents a smooth surface for the cake, minimizing sliding friction, abrasive wear and product degradation.

- The open structure of the screen’s outer diameter makes it easy to backwash and remove crystalline products that form in some applications.
Since B&P is in the Business of meeting individual customer needs, it only follows that we have paid particular attention to customer support.

Rebuild. Who better to rebuild your Baker Perkins and B&P machines than the folks who made them in the first place? Critical tolerances are restored to their original specs. B&P can supply new OEM parts as required. Also B&P can upgrade your old equipment to meet current safety and environmental regulations.

Through our Houston Service Center we can provide complete engineering, field service, and replacement parts documentation. Our on-site engineering experts promise quick turn-around, attentive follow-up support and a six-month warranty.

Global Field Service. The B&P Field Service Team has logged over a million miles per man traveling the globe trouble-shooting Baker Perkins and B&P machines.

B&P will go wherever you are with technical support for new start-ups, training seminars for customer maintenance and production staff, machine evaluations, appraisals of Baker Perkins and B&P machinery, and Product Maintenance Programs.

Customer Service. B&P is the key to your machine’s past and its future productivity. We have your original blueprints no matter how old the machine is, and a complete service and parts replacement record from over the years.

B&P’s expert engineering staff works with OEM parts for precise fit and top performance wherever possible and we will manufacture custom replacement parts whenever necessary. B&P can even show you how to set up a Customer Part Inventory Program so you can stock optimal levels of replacement parts yourself and minimize downtime even further.

No Orphans
No B&P machine is ever an orphan. Ever! This really says something since there are Baker Perkins and B&P machines still going strong out after 80 years. But B&P’s Customer Service Group won’t let them go. B&P will support and service these workhorses forever.

B&P has records on all machines dating back over 50 years. We have your original prints. We know your machine’s history - what parts have been installed, when and why. With our top-caliber Global Field Service and Rebuild Groups knowing your machines as well as the guys who made them. And in some cases, they are the guys who made them.

B&P’s OEM parts perform like the originals. We will manufacture new components and drop ship them right to your doorstep. Fast! What we are trying to say is that B&P protects your investment and helps your process equipment live longer, with productive lives. Remember, we never, ever leave any orphans!

The strengths of the B&P Centrifuge are its modular design for special purposes, requiring less routine maintenance, less plate pulsing, enabling a wide range of applications, and its flexibility. The B&P Centrifuge is used in a variety of applications and types of agitated media, including: solids separation, solids dewatering, and solid-liquid separation. It is designed to accommodate various types of solids, providing consistent and reliable performance.

Operating Principle of Pusher Centrifuge

- **Pushing** - The stirrer is used to mix the slurry, whereas pusher-feeding products are conveyed via a screw conveyor system that pushes the slurry, which remains at the bottom of the vessel. The mix is then accelerated and directed into the vessel to wash, the solids are removed from the wash, and the washed solids are discharged from the vessel as a solid cake. The pusher plate is then rotated with the scratched and discarded, the solids are washed into the vessel, the solid cake discharged from the vessel, and the solids are removed from the wastewater. The B&P centrifuge has an impressive track record for reliability under all kinds of service conditions, making it a desirable device in these various applications.

Notable Design Features of the B&P Pusher Centrifuge

- **Highly efficient and reliable:** The design of the B&P centrifuge ensures high efficiency and reliability, providing consistent performance even under varying conditions.
- **Compact and versatile:** The compact and versatile design of the B&P centrifuge allows for easy installation and maintenance, making it suitable for a wide range of applications.
- **Energy-efficient:** The B&P centrifuge is designed to minimize energy consumption, making it an environmentally friendly option.
- **Robust and durable:** The robust and durable design of the B&P centrifuge ensures longevity and reliability, even under heavy usage.

Sample Applications of B&P Pusher Centrifuge

- **Chemical industry:** The B&P centrifuge is used in the chemical industry for the separation of solids and slurries, providing consistent and reliable performance.
- **Pharmaceutical industry:** The B&P centrifuge is used in the pharmaceutical industry for the separation of solids and slurries, providing consistent and reliable performance.
- **Food industry:** The B&P centrifuge is used in the food industry for the separation of solids and slurries, providing consistent and reliable performance.
- **Biological industry:** The B&P centrifuge is used in the biological industry for the separation of solids and slurries, providing consistent and reliable performance.

Process Challenges Solved by B&P Pusher Centrifuge

- **Highly sensitive solids:** The B&P centrifuge is designed to handle highly sensitive solids, ensuring consistent and reliable performance.
- **Low solids content:** The B&P centrifuge is designed to handle low solids content, ensuring consistent and reliable performance.
- **Crystalline material:** The B&P centrifuge is designed to handle crystalline material, ensuring consistent and reliable performance.
- **Particle purity:** The B&P centrifuge is designed to handle particle purity, ensuring consistent and reliable performance.
- **Energy consumption:** The B&P centrifuge is designed to minimize energy consumption, ensuring consistent and reliable performance.
